FOREWORD

The present dictionary is the first of a series of Chinese-English technical dictionaries under preparation by the Aerospace Technology Division of the Library of Congress. The purpose of the series is to provide rapid reference tools for translators, abstracters, and research analysts concerned with scientific and technical materials published in Mainland China. The first volume, AVIATION AND SPACE, contains over 12,400 terms selected from sources published in Mainland China. The terms included relate not only to aeronautical engineering, general aviation, rocket engines, astronavigation, etc., but incorporate vocabulary from the basic sciences and the auxiliary technologies closely associated with aviation and space, such as, telecommunications, metallurgy, welding, aircraft construction, etc.

The special features of this dictionary are Mainland Chinese practice in regard to: (1) terminology, (2) style of characters, (3) complete alphabetic lookup by means of the "pinyin" spelling.

The present volume should be considered as provisional pending publication of a revised and enlarged edition expected to exceed 20,000 terms. Other subject areas in the series will cover nuclear physics, automation and computer technology, electrical and mechanical engineering, surveying, mapping and meteorology, telecommunications, electronics, and rocketry.

ARRANGEMENT OF CHINESE ENTRIES

The Chinese written language is undergoing an evolution toward simpler forms, i.e., individual characters with reduced numbers of strokes. This process is in effect eroding the traditional classification of a character by its radical with a fixed number and the residual stroke count. As a result Chinese-English dictionaries published in Mainland China and elsewhere are resorting to a system of alphabetic lookup. The basis of this system is the "pinyin" spelling of Modern Standard Chinese as established in Mainland China. With a standardized spelling, a Chinese dictionary now resembles more nearly one of an alphabetic language.

In the dictionaries of this series, the Chinese entries are ordered in accordance with the transcription of the first character of the term. Homophones are arranged in order by syllable, tones 1 to 4, total stroke count, radical, and residual strokes. Succeeding syllables of an entry are in alphabetic order and where homophones in second place occur the one with the lower stroke count precedes.

A character index is provided for users less familiar with the pinyin spelling. It is a "total stroke" index with a visual radical column, the purpose of which is to eliminate tedious and time-consuming radical identification and subsequent counting of residual strokes before locating the desired character. A character located in the INDEX refers the reader to the page where terms beginning with this character are listed.

It is confidently expected that the presentation of Chinese technical terminology in an alphabetic lookup system will reduce access time for Chinese dictionaries to that of any other alphabetic language.
